<div class="df_qntext">Why do power systems need capacitors?

Their power systems rely on DC/DC converters and DC/AC inverters that require capacitors to reduce low-frequency ripple, filter high-frequency components that cause electromagnetic interference (EMI), and absorb transient load currents to prevent them from affecting the primary side of the power source.

<div class="df_qntext">How DC-link capacitor size affect voltage limit?

Table 4. Dc-link capacitor size at various ripple voltages of 370V and maintaining a voltage ripple under 8.5%. study. It is seen that the capacitance will decrease with the increase in dc input voltage which increases the voltage limit and to ensure a better and reliable system performance and to achieve high power density of the system.
