In a closed hydraulic system, an accumulator can be used effectively as a fluid make up device. The accumulator makes up the difference in fluid volume between the rod and the blind end of the hydraulic cylinder. Such a system is illustrated in Figure 2-5.

<div class="df_qntext">How does a hydraulic accumulator work?

The oil stored under pressure then is forced from the accumulator to the end of the cylinder, retracting the piston to the starting position. In a closed hydraulic system, an accumulator can be used effectively as a fluid make up device.

<div class="df_qntext">What are HYDAC hydraulic accumulators?

ROBUST AND VERSATILE: Wherever hydraulic tasks need to be performed, HYDAC hydraulic accumulators can help. They are versatile, make your machine more convenient to use, secure your hydraulic system and are used to increase the energy efficiency of hydraulic systems and for many other tasks.

<div class="df_qntext">What is a piston accumulator?

Available in several different pressures ranging from 75bar to 1035bar. In the renewables industry, piston accumulators control blade pitch, provide emergency power, and dampen vibrations in hydraulic systems. Piston accumulators ensure reliable shock absorption and fluid management in challenging oil and gas extraction environments.

<div class="df_qntext">What are accumulators used for?

One of the major industrial applications of accumulators is the elimination or reduction of high pressure pulsations or hydraulic line shock. Hydraulic shock or water hammer is usually caused by the sudden stoppage or deceleration of a fluid flowing at high velocity in a pipeline.

<div class="df_qntext">How does a raised weight accumulator work?

A raised weight accumulator consists of a vertical cylinder containing fluid connected to the hydraulic line. The cylinder is closed by a piston on which a series of weights are placed that exert a downward force on the piston and thereby pressurizes the fluid in the cylinder.
