<div class="df\_qntext">How does a pressure accumulator work?

An accumulator can maintain the pressure in a system for periods when there are slight leaks without the pump being cycled on and off constantly. When temperature changes cause pressure excursions the accumulator helps absorb them.

<div class="df\_qntext">How to pre-charge accumulator?

Accumulator should be pre-charged to approximately 2 to 3 Bar with oxygen free dry nitrogen. The fluid port should be capped with a suitable pressure plug after pre-charge. Refer to pre-charging procedure under 4.0 Commissioning. valve cap, and stem protective cap. with the top of the fluid port connection. It fluid should be used.

<div class="df\_qntext">How long does a hydraulic accumulator last?

All pressure vessels manufactured to these standards are considered to have a finite service life depending on the number of pressure cycles experienced during normal operation. The typical design life for a hydraulic accumulator is 12 years. In many jurisdictions, periodic inspection and recertification is required.

This can make a difference for very small accumulators, which lose a relatively large part of pre-charge every time a direct gas pressure measurement is performed. Although this method doesn't provide ...
