

Indium phosphide solar container battery

<div class="df_qntext">Can indium phosphide be used as a reference material?

CC-BY 4.0. Renewable ("green") hydrogen production through direct photoelectrochemical (PEC) water splitting is a potential key contributor to the sustainable energy mix of the future. We investigate the potential of indium phosphide (InP) as a reference material among III-V semiconductors for PEC and photovoltaic (PV) applications.

<div class="df_qntext">Can p-doped indium phosphide (100) quantum dots be used as a single-photon source?

For example, recent work by Proppe et al. explored the use of colloidal p-type, P-doped indium phosphide (100) quantum dots as a single-photon source for application in quantum photonic techniques. (40) In our investigation, we focused on the P-rich p (2 \times 2)/c (4 \times 2)-reconstructed InP (100) surface prepared by MOVPE.

<div class="df_qntext">What are the different types of indium phosphide substrates?

Classic indium phosphide substrates, on the other hand, are currently available in sizes from 2 to 4 inches, with a 6-inch version only recently becoming available. This is because gallium arsenide substrates are more robust and formats with a diameter of up to 8 inches are already well established in the semiconductor industry.

<div class="df_qntext">Can indium phosphide be produced on gallium arsenide substrates?

Together with the company III/V-Reclaim, scientists at the Fraunhofer Institute for Solar Energy Systems ISE have succeeded in producing high-quality indium phosphide on gallium arsenide substrates (InP-on-GaAs wafers) with up to 150 mm diameter.

<div class="df_qntext">Which semiconductor has the highest solar-to-hydrogen conversion efficiencies?

(1) To date, III-V semiconductors have demonstrated the highest solar-to-hydrogen conversion efficiencies. (2,3) Their direct band gaps, high electron mobilities, and low exciton binding energies in combination with good surface- and band gap tunability make them highly attractive for PEC and PV applications.
